

FAIRSHARE

SHARE EXPENSES, HASSLE-FREE

BY MANAV DODIA

THE PROBLEM

Have you been to a restaurant that doesn't do split bills? You decide to pay. you need to keep receipt photos, One friend pays you back - you have to calculate it's the right amount, others you have to chase up because they forgot, etc. ITS A NIGHTMARE

THE SOLUTION

Using FairShare, you simply take a photo of the receipt (or select from your photos), and the website will automatically list out items/quantities/prices.

From here, you show/send your friends the generated QR code, and they can fill in the items they want to pay for. Then, they can instantly pay you the right amount through Beem.

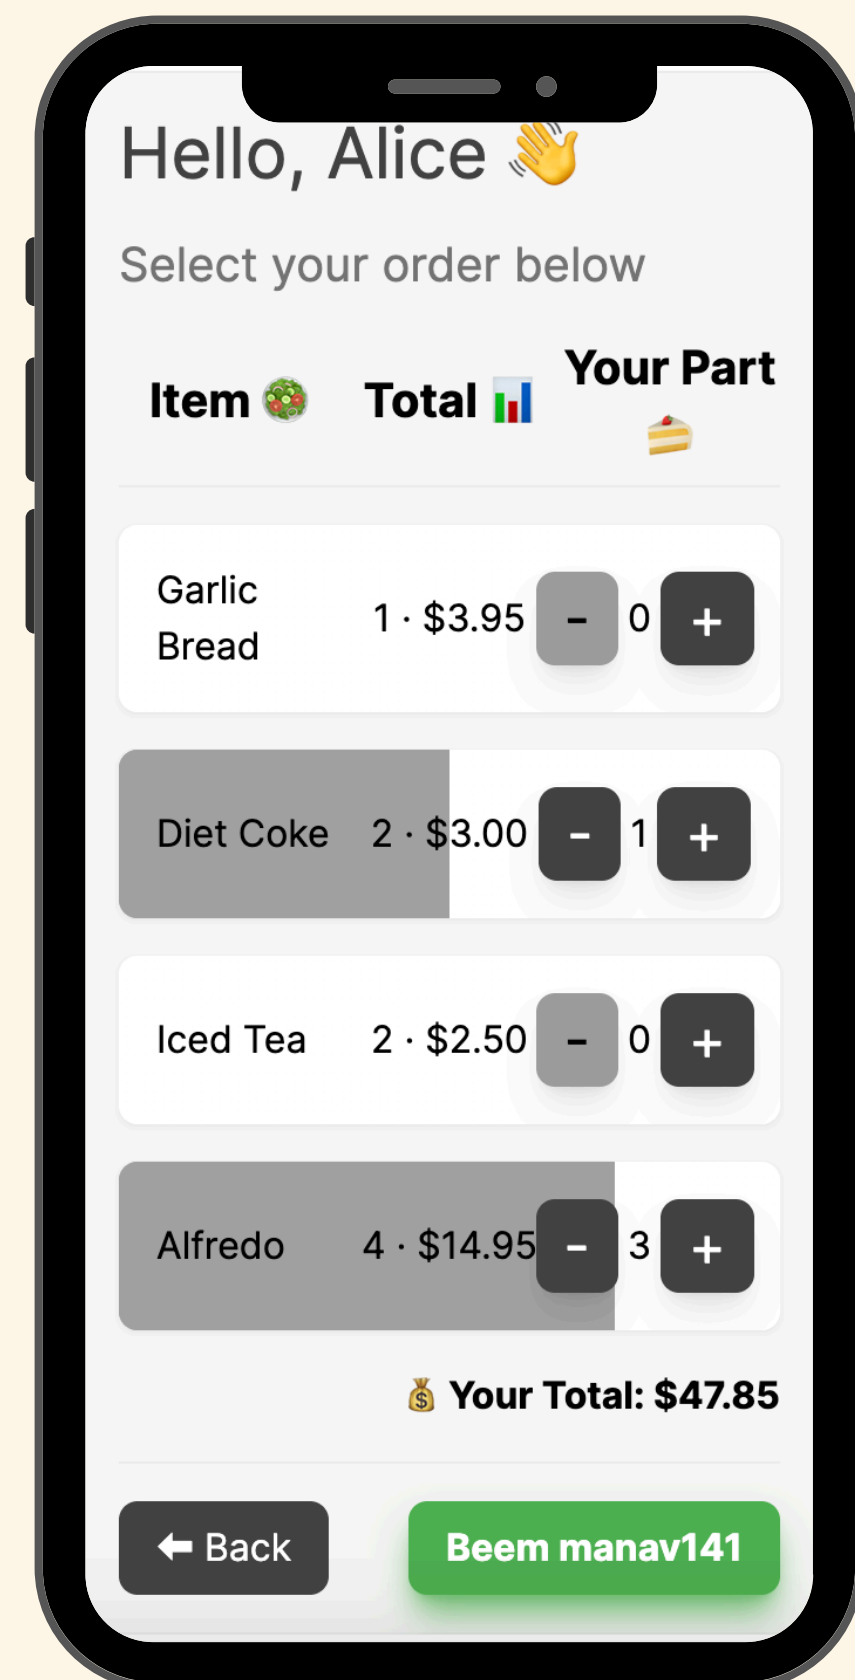

All of this allocation info is live for the user and their friends, so there's no double-paying either!

FAIRSHARE (USER POV)

Using OCR and NLP, FairShare takes your receipt photo, and converts it into a live interface with friend claims, amount owing, etc.

FAIRSHARE (USER'S FRIEND POV)

The user gets a QR code he can give his friends, and they will see a live interface to select items they want to pay for, and an easy Beem deep-link to pay the user

THE TECH...

tailwind CSS / React - makes the UI/UX pretty/interactive!

Next.js / Node.js - backend/frontend, routing paradigm highly utilised

API - vision capabilities convert user image to JSON. Initially OCR (object-character-recognition) model, refactored to gpt-4o

Supabase - a publisher-subscriber model postgresSQL database is used to store user data and provide real-time updates to all users
